Glossary

Term	Definition
Bill of Materials	A Bill of Materials is a list of the raw materials, assemblies, sub-assemblies, parts and components, as well as the quantities of each needed to manufacture a product.
Carbon Neutrality	In Logitech, Carbon Neutrality is defined as the end state that is achieved when a company reduces their absolute emissions as much as practically possible and addresses all residual emissions with carbon offsets or carbon removals.
Carbon Offsets	Carbon Offset Projects are projects that avoid greenhouse gas emissions that would have otherwise been created, if the project were not in place. Examples include conservation of forestry (where the forestry would have otherwise been harvested) and support of renewable projects (to avoid the emissions that would have arisen if the power was generated by fossil fuels). A company provides financial support to these projects and project activities by purchasing carbon offsets.
Carbon Removals	Carbon Removal Projects are projects that remove greenhouse gas emissions from the atmosphere. Examples include new forestry and technological solutions. A company provides financial support to these projects and project activities by purchasing carbon removals.
Climate Positive Approach	Logitech's commitment to a climate positive approach is a commitment to maintain Carbon Neutrality year-on-year by designing for sustainability, using renewable energy and investing in high-quality, certified projects to offset and address the company's residual carbon impact until Logitech removes more carbon than they create.
Science-based approach	Logitech is committed to the Science-Based Targets Initiative (SBTi) and setting ambitious reduction targets, which comply with SBTi standards and are reflective of current climate science. Logitech's reduction targets, as mentioned in this report, are currently being validated by SBTi.
Scope 1 emissions	Greenhouse gas emissions associated with use of fossil fuels and refrigerants at Logitech's production facility and offices.
Scope 2 emissions	Greenhouse gas emissions associated with use of electricity at Logitech's production facility and offices.
Scope 3 emissions	Greenhouse gas emissions from Logitech's value chain. These emissions are not under Logitech's direct control but Logitech can influence suppliers, downstream distributors and customers.

1. Introduction

This Report includes information on the carbon footprint of the Logitech hardware products advertised as carbon neutral under the Logitech brands (Logitech, Logitech G, Astro Gaming, Blue Microphones, Ultimate Ears) from January 1st 2022 to December 31st 2022 (the “Products”).

This Report and Annexes have been prepared in accordance with French Decree 2022-539 of 13 April 2022 on carbon compensation and carbon neutrality claims in advertisements. A list of the products commercialized in France from January 1st 2022 to December 31st 2022 is provided in [Annex 4](#).

2. Carbon Footprint of Logitech Products

Logitech’s carbon footprint evaluation of the Products includes modeling and calculation of greenhouse gas emissions across the full life-cycle, from sourcing of raw materials through manufacturing, distribution, product use and product end-of-life. The considered scope, data sources, methodologies, limits and exclusions are detailed in [Annex 1](#).

3. Carbon Reduction

In 2019, Logitech committed to the Paris Agreement and adopted a science-based approach to set ambitious climate reduction targets to help limit global warming to 1.5°C.

Logitech has committed to reducing their Scope 1 and Scope 2 emissions by 85%, compared to a 2019 baseline and to take ambitious action to reduce their Scope 3 emissions. Their current target is to reduce their Scope 3 emissions by 50% by 2030 compared to the 2021 baseline. Achieving absolute reductions in carbon is the cornerstone and priority of their Climate Action Strategy and Logitech is committed to maintaining carbon neutrality

year-on-year until they achieve their stated targets. Logitech implements this approach for their entire product portfolio and value chain.

Since 2019, Logitech has reduced its global carbon footprint (Scope 1, 2 and 3 emissions) by more than 25%. The actions and strategy of Logitech to reduce their carbon emissions, as well as the reduction trajectory, are described in [Annex 2](#).

4. Compensation of residual emissions

Logitech's priority is to reduce their carbon footprint by designing for sustainability and catalyzing the transition to renewable electricity. In addition to those priority goals, for residual emissions that the company cannot yet reduce and eliminate, Logitech have developed a rigorous process to select and support high quality carbon offsetting and removal projects from established partners with a history and reputation for best practice.

Logitech purchases carbon instruments, which are certified to established and recognized verification standards, and carries out appropriate due diligence reviews of their partners and projects, to confirm verifications. Further information on Logitech's compensation strategy is available in the [annual Impact Report](#) (Climate Action section) and the compensation projects that the company has invested in over time, are disclosed on the [Climate Action webpage](#) of logitech.com. Further information on the specific instruments and projects that Logitech purchased from, for Calendar Year 2022, is detailed in [Annex 3](#).

5. Certifying carbon neutrality

Logitech's achievement of carbon neutrality was third-party certified for the first time for Calendar Year 2021 and Logitech's certificate of achievement is available on the website ([Logitech Certificate of Achievement for Calendar Year 2021](#)). As shown on the certificate, Logitech's entire portfolio of products, commercialised worldwide in Calendar Year 2021, was

certified carbon neutral by SCS Global Services in accordance with SCS-108 Certification Standard for Carbon Neutral Entities, Buildings, Products and Services (Version 1.0) and the GHG Protocol Product Life Cycle Accounting and Reporting Standard.

At the beginning of 2022, Logitech made a commitment to Carbon Neutrality for Calendar Year 2022 and put processes in place to track, report and address carbon footprint arising from Logitech 2022 portfolio, as they arose, over the course of Calendar Year 2022. That commitment was certified by SCS Global Services with Logitech’s commitment to offset up to 1.5 million tons of carbon footprint arising from products placed on market over the course of Calendar Year 2022 ([Logitech \(forward-looking\) Commitment to Carbon Neutrality for Calendar Year 2022](#)). The achievement of carbon reductions during Calendar Year 2022, and the retirement of offsets to address residual carbon and achieve carbon neutrality is currently being verified by SCS Global Services. The resulting 2022 Carbon Neutrality Certificate (Logitech Certificate of Achievement for Calendar Year 2022) will be posted on their website, as soon as available and no later than June 30, 2023.

In addition to the existing [Climate Action webpage](#) on logitech.com, Logitech also has a [Carbon Clarity webpage](#), which provides further information for consumers regarding their commitment to carbon transparency, best practice life-cycle analysis modeling and the addition of carbon impact labels to Logitech products.

Annex 1: Carbon Footprint

This Annex provides further information on the data sources, scope, methodology and boundaries of their carbon footprint methodology.

1.1 Life Cycle Assessment

Logitech assesses the carbon footprint of the products in its portfolio using life-cycle assessment (“LCA”) models.

Each LCA Study is an estimate of the carbon footprint of product lines over a given period of time. Logitech product lines are commercialized as regional SKUs (stock keeping units), which may differ from each other in the following ways. These differences may lead to minor differences in the carbon impact of various SKUs associated with one product line.

- Regional variations in packaging, due to different packaging variants and compliance requirements in different regions.
- Variation in the color of the product.
- Variation in the proportion of recycled plastic due to the color of the housing.

When choosing a product to study, Logitech selects the worst-case scenario SKU to assess the sourcing and manufacturing impact e.g. the SKU with the highest packaging weight and lowest recycled material. The results for that study are then applied to all other related SKUs as a worst-case scenario. For the life cycle phases of transport, use and end-of-life, all shipped SKUs in the scope of the LCA study are considered.

1.2 Scope

1.2.1 Functional Unit

The functional unit for all LCA studies is the product unit – a selected and worst-case scenario SKU. The functional unit includes associated packaging (end-user and shipping) and any associated batteries. The functional unit specifically covers working mode over a period of two years.

1.2.2 Boundaries of the considered system

The LCA boundaries of the considered system are cradle-to-grave.

Each study takes into account four lifecycle stages:

- Sourcing & Manufacture (includes assembly;
- Distribution (all aspects of transportation);
- Use; and
- End of life.

Further details with respect to the assumptions and limitations associated with each lifecycle phase are provided in the Methodology section.

In accordance with the rules of chapter 6.3.4.3 of DIN EN ISO 14067:2018, some cut-offs may be made, for LCA studies of some products. Where cut-offs arise, they are reported as data exclusions in LCA Study reports, for relevant products. Cut-offs are made based upon the following conditions and criteria:

- One cut-off does not exceed 1% of the total GWP impact
- The total GWP of all cut-offs does not exceed 5% of the total GWP impact

1.2.3 Life Cycle Analysis phases and associated processes

The processes that are taken into account for each phase of the life-cycle are defined in the following table.

Table 1 Activities taken into account for each life-cycle phase

Lifecycle Phase	Activities taken into account
Sourcing & Manufacture	<p>Producing and processing raw materials for products and packaging including extraction, processing, transportation and production of raw materials, components and final products.</p> <p>The carbon impact of capital goods is accounted for at the corporate level, where it relates to spending on capital goods at their own production facility. For product carbon footprints, capital goods are excluded since large quantities of products are assembled, it is assumed that the share of impact coming from capital goods such as machines can be neglected.</p>
Distribution	<p>Transportation from:</p> <ul style="list-style-type: none"> ● component suppliers to assembly facility, ● assembly facility to distribution centres, ● distribution centres to customers, ● customers to end-users, ● end-users to end-of-life.
Consumer Use	<p>End-user use of the product for two years, taking into account:</p> <ul style="list-style-type: none"> ● electricity consumption of the product, ● electricity consumption of the USB dongle (receiver) (if applicable), ● production of non-rechargeable batteries (if applicable), ● the waste from packaging and non-rechargeable batteries (if applicable).
End-of-life	<p>End-of-life treatment (recycling, incineration or landfilling) of:</p> <ul style="list-style-type: none"> ● The product (hardware) ● The battery or non-rechargeable batteries, where they arise ● The end-user packaging e.g. paper ● The shipper packaging e.g. master shipper and pallet

1.2.4 Geographical Scope

Logitech Products are manufactured in Asia and distributed world-wide. Emissions associated with each phase of the product lifecycle are evaluated using country-level emissions factors and taking into account the location of their suppliers, distributors and end users. In some cases, GaBi datasets for specific components are not available for China and some specific countries of manufacturing and the best available data is used.

1.3 Data Sources:

Obtaining credible and high-quality data is crucial when undertaking any life-cycle analysis study. Using the most accurate data available creates lower bias and uncertainty. This section defines the primary and secondary data sources used in LCA studies.

1.3.1 Primary Data

The following primary data is collected by Logitech for use in LCA modelling.

Table 2 Primary data sources

Phase	Data sources
Sourcing & Manufacture	<ul style="list-style-type: none"> Product Bill Of Materials¹ (“BOM”) – for EE components Product teardown data (disassembly by hand to validate the mass of product components in the BOM) – for other components and materials Manufacturing operation data including: annual consumption of operating resources at their own factory; and yield rates
Distribution	<ul style="list-style-type: none"> In-house shipping records for transportation of the type, weight and distances of travel associated with transportation of components from component suppliers to Logitech’s production facility in Suzhou. In-house shipping records of the type, weight and distances of travel associated with transportation of packaged products from factories to distribution centres and distribution centres to customers Emission factors for modes of transport and shipping lanes from the Global Logistics Emissions Council (GLEC).
Consumer Use	<ul style="list-style-type: none"> Technical datasheets and engineering records of the energy consumption of the product, the dongle (USB receiver) (if applicable). Type of battery, battery capacity, number of batteries needed for a two-year period, number of replacement batteries required for a two-year period (if applicable). Consumer country (shipping records). Electricity mix and electricity emission factors for the grid in the consumer country. Logitech studies of product usage time, which were critically reviewed. Calculation of electricity use and non-rechargeable batteries (if applicable) during the estimated usage time. For Logitech’s most recent product carbon footprints, all electricity mixes are calculated according to the quantity shipped. Previously, only the electricity mix

¹ A Bill of Materials is a list of the raw materials, assemblies, sub-assemblies, parts and components, as well as the quantities of each needed to manufacture a product.

	data sets of those countries that covered 80% of the respective sales region of the quantity shipped products were used and then scaled up to 100%.
End-of-life	<ul style="list-style-type: none"> • Logitech's records of the weight of hardware, batteries, paper packaging, plastic packaging and shipper packaging, associated with each product. • End-of-life scenarios for each country of product distribution - developed by Logitech in consultation with recyclers. • Carbon emission factor for each end-of-life scenario: recycling, incineration, sanitary landfill, unsanitary landfill - taken from the Compass LCA tool, which in turn uses publicly available sources such as Eurostat or the EPA.

Because primary data inherently has the highest likelihood of containing errors, additional plausibility checks are performed by:

- Comparison of generic BOM data with practical disassembly of selected components and counting and weighting of components where possible by Logitech;
- Check of the supplier's BOM for inconsistencies and enrichment with further information such as production processes by Logitech;
- Comparison of remodelled components results in GaBi with generic datasets fromecoinvent; and
- Literature research.

1.3.2 Secondary Data

Secondary data comprises background datasets that are selected from GaBi and Ecoinvent databases. Logitech's approach to the selection and ongoing management of key datasets in the GaBi and Ecoinvent database has been validated by independent experts as part of a third-party review process.

Table 3 Secondary data sources

Database	Description
GaBi	<ul style="list-style-type: none"> • Widely recognized for its high quality data source. It is well-regarded in the LCA community and offers a wide range of LCI datasets, especially for electronic components.

	<ul style="list-style-type: none"> GaBi datasets are used for all lifecycle stages in Logitech models. Logitech uses a version of the GaBi database which also incorporates ecoinvent's datasets and in which ecoinvent's flow hierarchy is completely matched to the GaBi flow hierarchy for a full compatibility with the other GaBi databases.
Ecoinvent version 3	<ul style="list-style-type: none"> The largest LCI database in the world. It contains more than 13,300 datasets and offers a variety of new and updated data with good coverage of material and process data as well as data for in the End of Life phase. For generic processes, datasets for the most relevant region are selected. In cases where a regional dataset is not available, Logitech uses datasets that are. However, for several processes, only global or rest-of-world averages exist in the databases. GaBi was used for all stages, ecoinvent datasets were only used for limited aspects of the model for which no GaBi datasets were available.

1.4 Methodology, Assumptions & Limitations

An overview of Logitech's LCA methodology, assumptions and limitations for each phase of the product life cycle is provided in this section.

Sourcing & Manufacture

Logitech's methodology was developed in partnership with iPoint consultants and conforms with ISO 14067:2018 and ISO 14044:2006 standards and was critically reviewed by DEKRA SE. Biogenic emissions are excluded in accordance with ISO 14064. Logitech's LCA methodology, assumptions and limitations for the Sourcing & Manufacturing phase is provided in the table below.

Table 4 Sourcing & manufacture phase methodology

Methodology	Key Assumptions & Limitations
Product and packaging components are incorporated into the model, according to the Bill of Materials (BOM) and validated tear-down data. <ul style="list-style-type: none"> Logitech uses BOM data and technical specifications provided by suppliers, for analysis of EE 	In some cases, discrepancies between the reported BOM data and the tear-down data are identified and the tear-down data is assumed to be correct, for all product units. Paintings and finishing are included in the BOM. The model takes into account the total amount of paint

<p>components.</p> <ul style="list-style-type: none"> - For other components, Logitech carries out product tear-downs to disassemble the product by hand and validate the reported mass of each component. <p>GaBi and Ecoinvent datasets for each material type and component are used to model the carbon impact of the identified components and materials.</p>	<p>used to spray each component part and therefore waste is also accounted for.</p> <p>In some cases, GaBi datasets for specific components are not available for China and some specific countries of manufacturing and the best available data from other regions is used. In the case of integrated circuits (IC) and Printed Circuit Boards (PCB), Logitech recognizes the potential for this limitation to significantly impact the accuracy of the study and a country-specific correction factor is used for the regionalization of electricity consumption. For some materials, assumptions had to be made, like assuming production processes.</p>
<p>The carbon impact associated with final assembly of product components to assemble the final packed product is calculated using primary data from Logitech own production facility in Suzhou (China) which is used to produce many different products. General energy consumption and operating material consumption figures are available for the entire plant.</p>	<p>For products that are assembled at third-parties (i.e. not in-house), Logitech does not have primary data on the detail of third-party assembly activities and the data from the Logitech assembly factory in Suzhou (China) is used as a primary proxy. General energy consumption and operating material consumption figures are available for the entire plant. Depending on the country of the contract manufacturer, the corresponding country-specific electricity mix is used.</p>
<p>Data from third-party reviewed studies are extrapolated to other product lines, using a proxy approach. If an LCA model does not exist for a specific product architecture, a 'proxy' LCA model is identified. This proxy should represent a 'best fit' for the product</p>	<p>The procedure for selecting a 'best fit' LCA model for a product architecture that does not have an existing LCA model available is established by finding commonalities between a product and a proxy under the criteria shown in the table below.</p> <p>If a product cannot be matched appropriately through the commonality investigation then a worst case proxy is selected based within the appropriate product category. 'Worst case' in this context means obviously higher impact based on key criteria like architecture features set or weight.</p>

Distribution

Logitech's *Logistics Carbon Calculator (the LogiLoCC)* was developed in collaboration with the [Smart Freight Centre \(SFC\)](#) - a global non-profit organisation

dedicated to sustainable freight. The model was developed to reflect best practice standards, as defined by the *Global Logistics Emissions Council Framework for Logistics Emissions Accounting and Reporting Version 2.0* (“the GLEC Framework”, available for download from [here](#)). The GLEC Framework was developed by the SFC, to establish a harmonized methodology for the calculation and reporting of GHG emissions from global supply chains. It is aligned with the GHG Protocol and consolidates existing methodologies developed for individual transport modes and regions. Logitech’s LCA methodology, assumptions and limitations for the Distribution phase is provided in the table below.

Table 5 Distribution phase methodology

Methodology	Key Assumptions & Limitations
<p>Logitech’s methodology was developed in collaboration with the Smart Freight Centre and accredited to the Global Logistics Emissions Council Framework for Logistics Emissions Methodologies (“the GLEC Framework”, available for download from here).</p>	<p>Well-to-wheel GHG emissions, according to the scopes of the GHG Protocol Corporate Value Chain, Accounting and Reporting Standard. Modal coverage: road, rail, air, inland waterways, sea, where applicable Geographic coverage includes Inbound, outbound distribution and downstream transportation to end users.</p>
<p>The carbon impact associated with transportation of product components to the final assembly factory is calculated using primary data from Logitech shipping records and their own production facility.</p>	<p>For products that are assembled at third-parties, Logitech does not have primary data recording the distance travelled from component factories to final assembly factories and assumes the carbon impact is the same as if the product was assembled by Logitech and at Logitech’s own production facility.</p>
<p>The transportation from factory to distribution centres (DC) and DC to Customer is modelled using Logitech shipping records of the weight and number of product units shipped via different shipping lanes and distances to destination countries, along with the mode of transport for each lane. The carbon impact of DC storage is modelled using a third-party verified average provided by the Smart Freight Centre based on research in the sector and, assuming ambient temperature</p>	<p>Logitech’s Lane Map is developed by Logitech’s global Supply Chain team in collaboration with suppliers and taking into account data insights from direct experience of shipping patterns. In all cases, reasonable assumptions are made to define the typical distances and modes used and exceptional cases may not be represented.</p>

<p>The transportation from customer to end-user is a small proportion of the full distribution journey (“the last mile”) and is calculated taking into account distance travelled, mode of transportation and relevant emission factors.</p>	<p>Assumptions have been made with respect to the average distances and modes of transport in each region. All assumptions were developed in collaboration with the Global Logistics Emissions Council (GLEC) and third-party certified.</p>
<p>Emission Factors are taken from the GLEC Standard and reflect the insights and experience of the GLEC membership for regional lanes and shipping infrastructure used.</p>	<p>Emissions from the following sources are excluded, as per the GLEC Framework, for reasons of data availability and practicality::</p> <ul style="list-style-type: none"> • fuel spills and leakages (unless already embedded within fuel emission factors) • combustion of aviation fuels in high atmosphere • So-called “Black Carbon” (short-lived, particular matter, which is a climate pollutant with potential global warming potential and a negative effect on human health) • administrative activities of organizations e.g. office activities unrelated to the moving, storage and handling of freight. • Production, construction, maintenance or scrappage of vehicles or transport infrastructure.
<p>Transportation from end-users to the end-of-life stage is considered by literature data.</p>	<p>No data exists for this segment of distribution. Therefore, distances used in ecoinvent market datasets are taken as best available estimation</p>

Consumer Use

Logitech’s methodology was developed in partnership with iPoint consultants and conforms with ISO 14067:2018 and ISO 14044:2006 standards and was critically reviewed by DEKRA SE. Biogenic emissions are excluded in accordance with ISO 14064. Logitech’s LCA methodology, assumptions and limitations for the Consumer Use phase is provided in the table below.

Table 6 Consumer use phase methodology

Methodology	Key Assumptions & Limitations
-------------	-------------------------------

For this phase, product-specific energy consumption data is sourced from Logitech engineering and each product is modeled as having a working mode over a period of two years with a conservative use scenario using region-specific electricity mixes.	Assuming a two-year use period If a receiver is required to use the product, the energy consumption of the receiver is also considered in the study while the energy consumption of the PC/Laptop (not a Logitech device) is excluded.
Logitech carried out consumer surveys and consumer behavior studies to electricity use over the lifetime of products and the lifetime of any batteries used.	For office headsets, it is assumed that a headset is not worn permanently while working and is therefore actively used. It is assumed that gaming headsets are used in the same way as gaming mice, as it is anticipated that both will be used together.

End-of-Life

Logitech’s LCA model for end of life was developed in collaboration with third-party consultants leveraging insights from recycling partners, literature review and existing third-party modeling tools. The methodology, assumptions and limitations for the End of Life phase is provided in the table below.

Table 7 End of life phase methodology

Methodology	Key Assumptions & Limitations
<p>Logitech maintains data on the weight of products, packaging, batteries and packaging shipped to different countries worldwide.</p> <p>This weight data is combined with end-of-life scenarios that have been developed for each country, in consideration of country-level legal requirements, the Compass LCA tool (which in turn uses publicly available sources such as Eurostat or the EPA), and feedback from Logitech’s recycling partners. This information is used to model the likely end-of-life scenario for shipped units i.e. % recycled, incinerated, landfilled etc.</p> <p>A contingency factor of 2% is added to cover additional waste that may arise during the</p>	<p>Biogenic emissions are excluded in accordance with ISO 14064.</p> <p>Logitech adopts a worst-case scenario approach and assumes 0% of plastic packaging is recycled. Logitech’s knowledge from recycling partners is that the plastic packaging components are collected and can be recycled in many cases (i.e. it is technically feasible to recycle them) but they do not get recycled in practice because recyclers focus on other materials.</p> <p>Modeling of the recycling scenario includes all activities up to sorting and shredding of the units at the recycling facility. Processing of materials by the recycler or other third parties,</p>

sourcing and manufacturing phase, as advised by iPoint consultants and in consideration of typical yield factors for assembly and production.

to maximize recovery and reuse in other systems is not included. This is justifiable since it is common practice since the carbon impact associated with creating the second life materials is usually attributed to a separate industrial sector.

1.5 Carbon footprint of Products commercialized in France

For the purpose of reporting to French Decree 2022-539 of 13 April 2022 on carbon compensation and carbon neutrality claims, Logitech reports the carbon footprint associated with the Products commercialized in France from 01 January 2022 to 31 December 2022 amounted to 24,019.06 tCO₂e.

Annex 2: Carbon Reduction Trajectory

Introduction

Logitech's carbon reduction trajectory encompasses the entire company and will be achieved by prioritizing absolute carbon reductions in their Scope 1, 2 and 3 emissions and product lines. Their current objectives are based on the best scientific data available to date and rely on a science-based approach. Data sources and methodologies for capturing the full complexity of environmental impacts evolve year on year. Logitech will continue to invest time and resources to ensure the company is at the forefront of the developments and meet the evolving criteria as they are established.

Logitech's strategy to achieve carbon neutral products is global, which allows the company to reduce the emissions of all their products, including but not limited to the products commercialized in France. Reduction programs are not specific to a given product, nor to products commercialized on one specific market.

Logitech has defined a number of science-based carbon reduction targets, which are currently under validation by the Science-Based Targets Initiative. Those targets include the following.

- 85% reduction of Logitech's Scope 1 and 2 emissions by 2030 compared to the 2019 baseline.
- 100% elimination of Logitech's Scope 2 emissions 2030 through purchase of renewable energy instruments.
- 50% absolute reduction of Logitech's Scope 3 emissions (cradle-to-grave value chain) by 2030 compared to the 2021 baseline.
- 90% reduction in Scope 1, 2 and 3 emissions by 2047 from 2021 baseline with removal of all residual emissions to achieve net zero.

Carbon reduction programs

Logitech prioritizes absolute reductions in the carbon footprint of their products year-on-year. Examples of Logitech carbon avoidance and reduction programs are provided in the following table.

Table 8 Carbon reduction programs

Program	Description
Design for Sustainability (DfS)	<p>Logitech realizes that the biggest opportunities to reduce environmental impact arise early in the design process when key decisions about a product are made and carbon emissions can be avoided or designed out. Their DfS breakthrough goals focus on the acceleration of materials, components, processes, and business models needed to make their products more sustainable. Logitech embeds DfS goals directly into their product development process to ensure that sustainability is not just an afterthought - it is part of every design decision. Their goals to reduce the environmental impact of their existing portfolio drive an ambitious program of design, materials and process optimizations.</p>
Purchased Renewable Energy	<p>Logitech uses renewable electricity, where green utility providers exist. Where this is not possible, Logitech purchases high-quality, third-party certified, Energy Attribute Certificates (EACs) to match their electricity demand. These instruments are purchased from established and reputable vendors and Logitech have due diligence processes in place to verify the validity of any instruments purchased.</p> <p>Logitech has established a Renewable Energy Portal for their Tier 1 Suppliers - to enable supplier access to high-quality renewable electricity products and share their knowledge and experience of renewable energy purchasing and due diligence requirements. Logitech surveys their Tier 1 suppliers year-on-year to share good practice methodologies for measuring of energy and carbon footprints and encourage suppliers to engage with the Renewable Energy Portal and renewables market to address their Scope 2 emissions.</p>
Next Life Plastics	<p>Logitech has introduced post-consumer recycled plastic across a broad range of their products to give end-of-life plastic a second life and help reduce their carbon footprint. The company's capability has grown rapidly as they have partnered with resin suppliers and molders to develop new and stronger resins in a range of colors and grades, while expanding their supply chain and refining their molding processes. Recycled plastic is now used at scale across Logitech, targeting the company's largest product portfolios for the most impactful carbon reduction.</p>

Low Carbon Aluminium	Logitech uses Low-Carbon Aluminum in many of their products, to reduce their carbon impact. Low- Carbon Aluminum is produced using a renewable energy source and this reduces the carbon impact of the aluminium by up to 80% when compared to traditionally produced grades of Aluminum.
Responsible packaging	Logitech optimizes packaging designs to ensure materials and components are used as efficiently as possible. The company uses responsibly-sourced renewable and recycled materials and they use materials that are curbside recyclable, where possible.

Carbon Reduction Year-on-Year

Since 2019, Logitech has reduced their carbon footprint as follows.

Table 9 Logitech Scope 1, 2 and 3 emission reductions

Year*	Scope 1 (tCO ₂ e)	Scope 2** (tCO ₂ e)		
CY19	Baseline: 895	Baseline: 1.954		
CY20	801	1.088	Scope 3 (tCO ₂ e)	Total (tCO ₂ e)
CY21	566	895	Baseline: 1.526.704	1.528.164
CY22	439	834	1.196.026	1.198.026

* Calendar Year i.e. 01 January - 31 December

** Market-based

Annex 3: Carbon compensation terms for the residual emissions

When searching for offsetting and removal projects to finance, Logitech works with established partners with a history and reputation for best practice. The company selectively procure high-quality projects, which are certified to established verification standards, and they check and verify the credentials of each project prior to investing. The objective is to ensure the concerned projects meet all the requirements of additionality, permanence and avoidance of double counting.

The carbon offsets and removal instruments are verified by independent third parties and listed on audited registers where the information is available to the public, as referred to

in the above Table. Logitech commits to disclosing the full scope of their project investments on their [Climate Action webpage](#) and the company is working to document their due diligence process and project selection criteria for disclosure on the same webpage later this year.

In Calendar Year 2022, Logitech chose to purchase certificates from a majority of projects located in Asia, in particular in China, as this is the region where the majority of their carbon emissions occur.

As Logitech’s programs are global, the volume of the carbon emissions to be compensated corresponds to the total footprint of their products commercialized globally in 2022. The details are provided in the following table.

Table 10 Carbon offsets and removals

Project Type	Project Name	Location	Certification	Cost USD/tCO ₂	tCO ₂
Forestry	Qianbei Afforestation Project	China	VCS2082 With CCB	>10	65,000
Renewables	Darajat Unit III Geothermal Project	China	VCS1188	< 10	100,000
Renewables	SHANDONG WENDENG ZHANGJIACHAN WIND FARM PROJECT	China	CDM673	< 10	81,494
